(54) 11-O-Alkylerythromycin A derivatives.

(57) Novel erythromycin A derivatives of the formula

wherein R is alkyl having 1 to 3 carbon atoms, and the pharmaceutically acceptable acid addition salts thereof are disclosed. They exhibit excellent *in vivo* antibacterial activity against Gram-positive bacteria and Mycoplasma species.

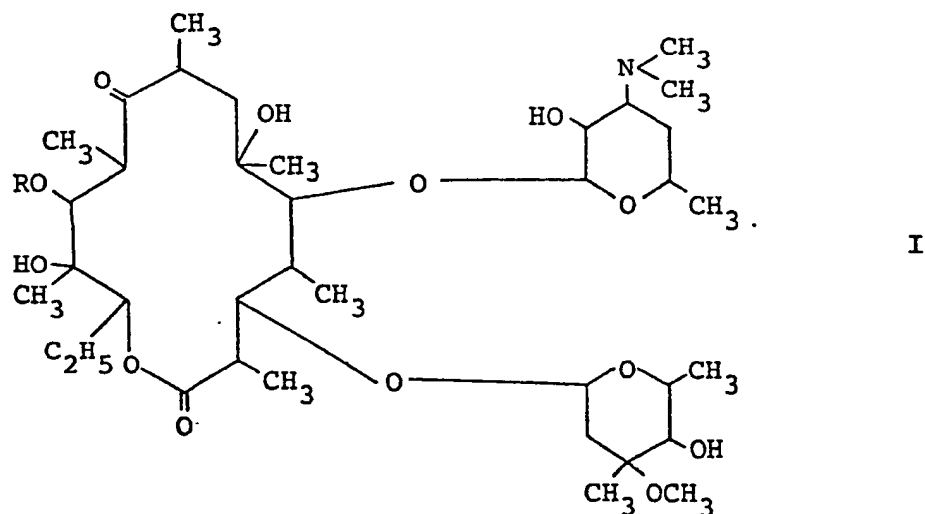

EP 0 080 819 A1

DESCRIPTION

The present invention relates to novel antibacterial agents. More specifically, it is concerned with novel 11-O-alkylerythromycin A derivatives having in vivo antibacterial activity against Gram-positive bacteria and Mycoplasma species.

The present invention is based on the discovery that new erythromycin A derivatives having 11-O-alkyl substituents exhibit higher in vivo antibacterial activity than other closely analogous compounds such as erythromycin A against Gram-positive bacteria.

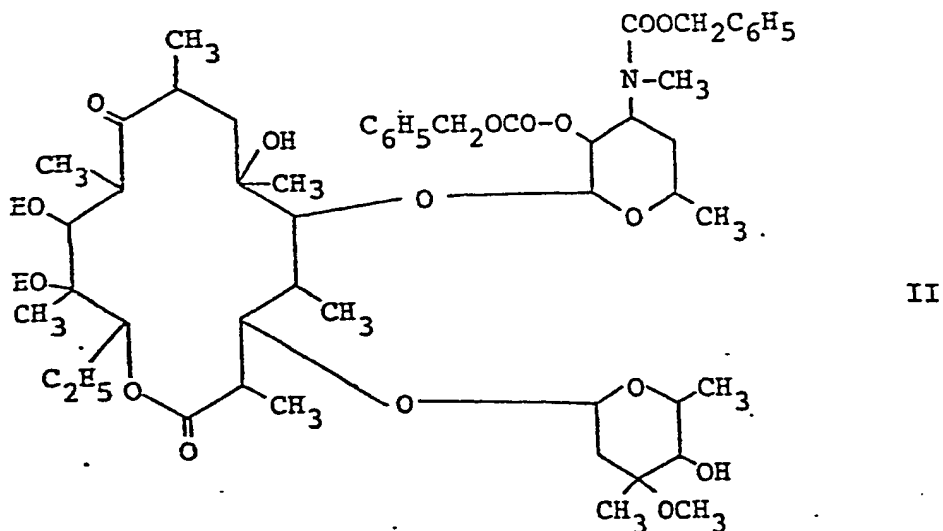

The compounds of the present invention are an erythromycin A derivative of the general formula

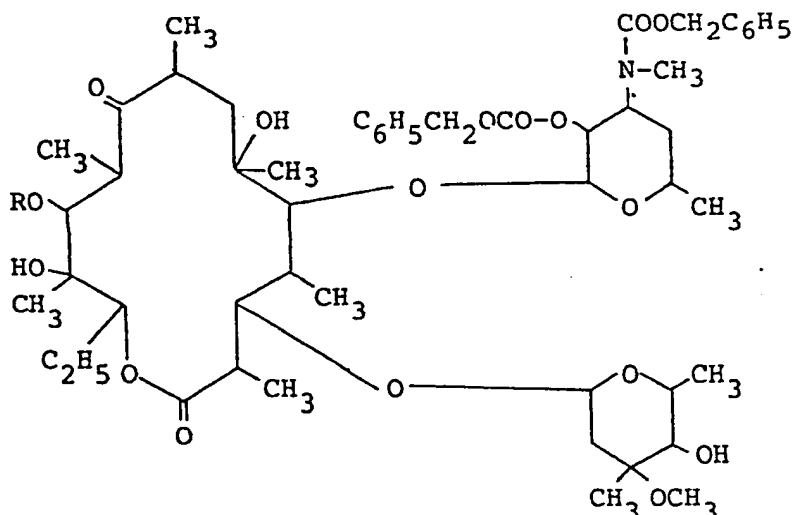

wherein R is alkyl having 1 - 3 carbon atoms, and pharmaceutically acceptable acid addition salts thereof.

Most preferred compound of the present invention is that of formula I wherein R is methyl group.

The compounds of formula I may be prepared, for example, by the following processes: Namely, a compound of the formula

is reacted with an alkylating agent such as methyl iodide, ethyl iodide, propyl iodide, dimethyl sulfate, methyl p-toluenesulfonate and the like, in the presence of a suitable base in a solvent in order to effect alkylation of the compound of formula II to give a compound of the formula

III

wherein R is defined above.

Examples of the base used in alkylation are alkali metal hydrides, e.g., lithium hydride, sodium hydride or potassium hydride; alkali metal amides, e.g., lithium amide, sodium amide or potassium amide; butyllithium; lithium diisopropylamide and the like.

The solvents used include inert solvents in which the compound of formula II is dissolved, for example, polar aprotic solvents such as N,N-dimethylformamide, N,N-dimethylacetamide, dimethylsulfoxide, hexamethylphosphoric triamide and the like, preferably N,N-dimethylformamide.

In alkylation, 5 - 10 moles of the alkylating agent, and 1 - 2 moles of the base are employed per mole of the compound of formula II. The reaction proceeds at the temperature ranging from -78 °C to room temperature, preferably from -10 °C to 5 °C.

The compound of formula III thus obtained may be worked up in a conventional manner, if desired, further purified by

recrystallization or column chromatography.

The compound of formula III is subjected to catalytic reduction according to the method reported by E. H. Flynn et al. in Journal of the American Chemical Society, 77, page 3104(1955) in order to eliminate the benzyloxycarbonyl groups, and then subjected to further catalytic reduction in the presence of excess formaldehyde to effect N-methylation, thus giving the compound of formula I.

The intermediate thus obtained by catalytic reduction for the above elimination may be used without isolation, or after isolation in a conventional manner for N-methylation.

Alternatively, when used the alkylating agent which hardly forms a quaternary ammonium salt with the 3'-dimethylamino group, the compound of formula I may be directly prepared by alkylation of erythromycin A with the above base and solvent.

Purification of the compound of formula I may be carried out by recrystallisation or column chromatography.

The pharmaceutically acceptable acid addition salt of the compound of formula I may be obtained by treating the compound of formula I with one mole equivalent of the corresponding acid described above in an inert solvent such as water, acetone, methanol and ethanol. The salts thus obtained are collected by filtration if they are insoluble in the inert solvent, by precipitation by addition of a non-solvent for the salt, or by evaporation of the solvent.

The starting material of formula II can be prepared

according to the above-described method of E. H. Flynn et al.

The compounds of the present invention have excellent in vivo antibacterial activity against Gram-positive bacteria and Mycoplasma species, therefore, they can be used as the antibacterial agents in mammals. For these purposes, a compound of formula I may be administered orally or parenterally in a conventional dosage form such as tablet, capsule, powder, troche, dry mixes, ointment, suspension or solution prepared according to conventional pharmaceutical practices.

The compounds of formula I can be administered at a dosage of from about 1 mg/kg to about 100 mg/kg of body weight per day. The preferred dosage range is from about 2 mg/kg to about 25 mg/kg of body weight per day.

The compounds of the present invention have excellent low toxicity. The LD₅₀ value in mice is in excess of 5000 mg/kg of body weight.

Following is a description by way of example only of methods of carrying the invention into effect.

Example 1.

(1) In 80 ml of N,N-dimethylformamide were dissolved 19.8 g of 2'-O-benzyloxycarbonyl-N-benzyloxycarbonyl-des-N-methylerythromycin A and 8.4 ml of methyl iodide. The solution was stirred under cooling at 0 - 2 °C in a nitrogen stream and 1.21 g of 50 % sodium hydride dispersion were added thereto in small portions. Stirring was continued for a further 30 minutes.

After completion of the reaction, 25 ml of triethylamine were poured into the reaction mixture with stirring under ice-cooling, and 300 ml of ethyl acetate and 150 ml of a saturated aqueous sodium chloride solution were added. The ethyl acetate layer was collected, washed with a saturated aqueous sodium chloride solution, and dried over anhydrous magnesium sulfate.

After evaporation of the solvent, the residue was then applied to a column chromatography (silica gel 60 for column chromatography produced by E. Merck Darmstadt, 70 - 230 mesh, ϕ 5.4 x 50 cm; and a mixture of ethyl acetate and n-hexane(1:1) as a developing solvent), and 15 ml each of fractions were collected. Thin layer chromatography (silica gel 60 F₂₅₄ produced by E. Merck Darmstadt, and a mixture of ethyl acetate and n-hexane(1:1) as a developing solvent) was applied to the detection of the product for each fraction, the fractions having a spot at R_f value of 0.09 were collected (cf., R_f value of the starting material 0.07), and the solvent was evaporated in vacuo to give 14.2 g of a colorless foam. Recrystallization from ether gave 11.7 g of the compound of formula III wherein R is methyl.

¹H-NMR(CDCl₃) : δ = 3.47(3H)

(2) In 10 ml of dry N,N-dimethylformamide were dissolved 2

g of 2'-O-benzyloxycarbonyl-N-benzyloxycarbonyl-des-N-methylethromycin A and 1 ml of dimethyl sulfate. The solution was stirred under cooling at 0 - 2 °C in a nitrogen stream, and 115 mg of 50 % sodium hydride dispersion was added thereto in small portions. Stirring was continued for a additional 30 minutes.

After completion of the reaction, the reaction mixture was worked out by the similar procedure to that of item(1) to give 1.4 g of the same compound as obtained in item(1).

(3) In 20 ml of a mixture of dry dimethylsulfoxide and tetrahydrofuran(1:1) were dissolved 1.7 g of 2'-O-benzyloxycarbonyl-N-benzyloxycarbonyl-des-N-methylethromycin A and 1 ml of methyl iodide. Methylation was carried out by the same procedure as that of item(1), except for the use of 192 mg of 50 % sodium hydride dispersion in place of 1.21 g of one to give 0.9 g of the same compounds as obtained in item(1).

(4) In a mixture of 1.2 ml of acetic acid, 60 ml of water and 300 ml of ethanol were dissolved 6 g of the compound of formula III obtained in item(1) and 2 g of sodium acetate. 0.6 g of palladium black was added, and the mixture was stirred for 5 hours at ambient temperature under atmospheric pressure in a gentle hydrogen stream to effect catalytic reduction. Into the resulting mixture was poured 20 ml of 37 % aqueous formaldehyde solution, and catalytic reduction was continued for a further 7 hours.

After completion of the reaction, the catalyst was filtered off and the filtrate was concentrated in vacuo to

approximately a quarter volume, to which were added 100 ml of water and an aqueous sodium carbonate solution to adjust to about pH 10. The mixture was extracted thoroughly with dichloromethane, the extract was washed with water and dried, and the solvent was distilled out.

The residue thus obtained was recrystallized from a mixture of acetone and petroleum ether, giving 3.73 g of 11-O-methylerythromycin A.

FD-Mass (m/e) : 747 (M^+)

IR $\nu_{\text{max}}^{\text{KBr}}$ cm^{-1} : 3500, 3440, 1738, 1732, 1705

$^1\text{H-NMR}(\text{CDCl}_3)$: δ = 2.30, 2.32 (6H), 3.30, 3.35, 3.37, 3.48 (6H)

$^1\text{H-NMR}$ data indicates that this product is a mixture of the tautomers, ie., hydroxyketone and hemi-acetal, when being dissolved in CDCl_3 .

Example 2.

In 40 ml of dry N,N-dimethylformamide were dissolved 7.3 g of erythromycin A and 4 ml of ethyl iodide. The solution was stirred under cooling at 0 - 5 °C in a nitrogen stream, and 594 mg of 50 % sodium hydride dispersion was added thereto in

small portions with stirring. Stirring was continued for a further 30 minutes.

After completion of the reaction, 10 ml of triethylamine were poured into the reaction mixture under ice-cooling, and 200 ml of ethyl acetate and 100 ml of a saturated aqueous sodium chloride solution were added. The ethyl acetate layer was collected, washed with a saturated aqueous sodium chloride solution, and dried over anhydrous magnesium sulfate. Evaporation of the solvent left the residue, which was then applied to a silica gel column chromatography (silica gel 60 silanized for column chromatography produced by E. Merck Darmstadt, 70 -230 mesh; and a mixture of chloroform and methanol(9:1) as a developing solvent) to give a colorless foam. Recrystallization from a mixture of acetone and petroleum ether gave 3.1 g of 11-O-ethylerythromycin A.

m.p. 123.5 - 126.5 °C (with decomposition)

Elemental analysis (for $C_{39}H_{71}NO_{13}$)

Calcd. (%): C, 61.47; H, 9.39; N, 1.84

Found. (%): C, 61.13; H, 9.29; N, 1.83

1H -NMR($CDCl_3$) : δ = 2.38, 2.33(6H), 3.38, 3.33(3H)

1H -NMR data indicates that this product is a mixture of the tautomers, ie., hydroxyketone and hemi-acetal, when being dissolved in $CDCl_3$.

Example 3.

Following the similar treatment to that of Example 2 using 11 g of erythromycin A and 16 g of n-propyl iodide, 6.6 g of 11-O-n-propylerythromycin A as crystals.

m.p. 121.5 - 125.5 °C

Elemental analysis (for $C_{40}H_{73}NO_{13}$)

Calcd. (%): C, 61.91; H, 9.48; N, 1.81

Found. (%): C, 61.63; H, 9.39; N, 1.76

Mass (m/e) : 775 (M^+)

IR ν_{\max}^{KBr} cm^{-1} : 3440, 1730

1H -NMR($CDCl_3$) : δ = 2.32, 2.34(6H), 3.32, 3.37(3H)

1H -NMR data indicates that this product is a mixture of the tautomers, ie., hydroxyketone and hemi-acetal, when being dissolved in $CDCl_3$.

The following experiment illustrates in vivo antibacterial activity of the compound of the present invention.

Experiment

Male ddY mice weighing 20 - 23 g in groups 20 each were inoculated with Staphylococcus aureus Smith No. 4 (10^7 cells per mouse, i.p.). Erythromycin A was used as a control, the compound of formula I wherein R is methyl group ("compound 1") was administered orally at one hour after inoculation, and the number of living mice for seven days after administration was

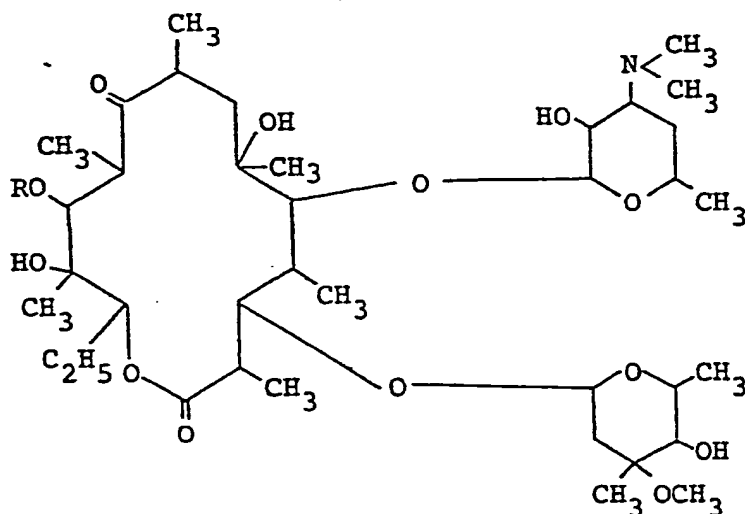

calculated to determine the in vivo antibacterial activity.

The results are shown in the following table.

<u>In vivo</u> Antibacterial Activity [The Number of Surviving Mice]		
dose (mg/mouse)	Test Compound	
	Compound 1	Erythromycin A
4	20	20
2	20	18
1	12	8
0.5	6	4

CLAIMS

1. An erythromycin A derivative of the formula

wherein R is alkyl having 1 to 3 carbon atoms, and the pharmaceutically acceptable acid addition salts thereof.

2. A compound according to claim 1 wherein R is methyl group.
3. A compound according to claim 1 wherein R is ethyl group.
4. A compound according to claim 1 wherein R is propyl group.
5. A compound as claimed in any preceding claim wherein the compound is in the form of an addition salt

- 2 -

selected from one or more of hydrochloric acid, hydrobromic acid, hydroiodic acid, nitric acid, sulfuric acid, sulfurous acid, phosphoric acid, organic acid, formic acid, acetic acid, propionic acid, butyric acid, lactic acid, citric acid, malic acid, glycolic acid, tartaric acid, succinic acid, maleic acid, fumaric acid, gluconic acid, stearic acid, mandelic acid, benzoic acid, methanesulfonic acid, aminoethanesulfonic acid, p-toluenesulfonic acid, glutamic acid and aspartic acid.

6. A pharmaceutical composition comprising a compound as claimed in any preceding claim together with a pharmaceutically inert diluent therefor.

7. A composition as claimed in claim 6 wherein the dosage is 1 mg to 100 mg/kg body weight per day.

8. A method of preparing the derivative of claim 1 wherein a compound of general formula II hereinbefore set forth is reacted with an alkylating agent in the presence of a suitable base in a solvent to obtain an intermediate compound having the general formula III hereinbefore set forth and thereafter subjecting said intermediate to catalytic reduction

to eliminate the benzyloxycarbonyl groups and then effecting further catalytic reduction in the presence of excess formaldehyde to effect N-methylation to produce a compound in accordance with formula I.

9. A method as claimed in claim 9 wherein in alkylation 5 to 10 moles of alkylating agent and 1 to 2 moles of base per mole of compound of formula II are employed.

10. A method as claimed in claim 8 or claim 9 wherein the alkylation reaction is carried out at temperatures from -78°C to ambient temperature.
